

Characteristics of Lawyers Who Are Subject to Complaints and Misconduct Findings

*Tara Sklar, Yamna Taouk, David Studdert, Matthew Spittal,
Ron Paterson, and Marie Bismark**

Regulators of the legal profession are charged with protecting the public by ensuring lawyers are fit to practice law. However, their approach tends to be reactive and case based, focusing on the resolution of individual complaints. Regulators generally do not seek to identify patterns and trends across their broader caseloads and the legal profession as a whole. Using administrative data routinely collected by the main regulator of the legal profession in Victoria, Australia, we characterized complaints lodged between 2005 and 2015 and the lawyers against whom they were made. We also analyzed risk factors for complaints and misconduct findings. We found that the odds of being subject to a complaint were higher among lawyers who were male, older, had trust account authority, and whose legal practices were smaller, in nonurban locations, and incorporated. A deeper understanding of these risk factors could support efforts to improve professional standards and reform regulatory practices.

I. INTRODUCTION

The neglect of legal malpractice law contrasts strangely with the attention devoted to its big sister, medical malpractice law. The latter has received much more attention from empirical investigators, analysts and legislators. (Ramos 1996:871)

Sklar is Professor of Health Law at James E. Rogers College of Law, University of Arizona; Taouk is Research Assistant at Melbourne School of Population and Global Health, University of Melbourne; Studdert is Professor of Law and Medicine at Stanford University; Spittal is Associate Professor at Melbourne School of Population and Global Health, University of Melbourne; Paterson is Professor of Law at Auckland University; Bismark is Associate Professor at Melbourne School of Population and Global Health, University of Melbourne.

The authors acknowledge the Victorian Legal Services Board and Commissioner for funding this research, with particular thanks to Commissioner Michael McGarvie, Russell Daily, Maggie McNamara, Christine Bell, and Abraham Dahdoule, for their guidance in extracting the data and interpreting the findings. We appreciate helpful comments and suggestions from David Hyman, Bill Madden, Jennifer Moore, Jordan Neyland, Christopher Robertson, Brad Wendel, Emily Taylor Poppe, Lisa Webley, and workshop participants at Melbourne Law School, New South Wales Law Society, Georgetown Law School O'Neill Institute, the 2017 Conference on Empirical Legal Studies, and the 2018 QuantLaw Conference at the University of Arizona College of Law.

Regulators of the legal profession—such as state bars, law societies, complaint commissions, and legal services boards—are charged with upholding professional standards of practice and protecting consumers of legal services. The public and the profession expect these regulators to take timely and appropriate action in response to complaints about the conduct and performance of lawyers. However, their approach tends to be reactive and focused on the resolution of individual complaints (Parker 2004). This case-based approach, coupled with limited resources and empirical expertise, means that regulators of the legal profession typically spend little time investigating patterns and trends across their broader caseloads and the legal profession at large. This is a missed opportunity. Regulatory agencies amass valuable data on patterns of concern about large populations of practitioners that, if analyzed carefully, could yield insights to help guide and improve regulatory oversight, supervision, training, and education (Bismark 2016).

Empirical quantitative research on lawyer misconduct is a growing field, but still lags behind similar efforts in the medical profession. Over the last decade a substantive body of empirical scholarship has improved medical regulators' understanding of patterns of complaints, malpractice claims, and disciplinary actions (Studdert et al. 2016; Jena et al. 2011; Rolph et al. 2007). More recently, medico-legal research has moved past large-scale descriptive studies to predictive analysis (Spittal et al. 2015). Arming regulators with an ability to identify high-risk practitioners, *before* they accumulate poor track records, permits more effective use of scarce regulatory resources, and may help target interventions that prevent adverse outcomes for doctors and patients.

Most empirical research on lawyer misconduct has used case studies (Abel 2008, 2012) or a combination of descriptive statistics and qualitative research (Bartlett 2008; Kritzer & Vidmar 2018) rather than analytical statistical methods. While these studies provide valuable insights into patterns of lawyer misconduct, to the best of our knowledge, no previous research has analyzed longitudinal lawyer-level data across an entire jurisdiction.

Why has quantitative research into lawyer misconduct lagged behind research into medical misconduct? There are three plausible explanations. First, medical misconduct is more likely than legal misconduct to pose public safety risks, trigger costly lawsuits, and capture the attention of the public and policymakers (Barton 2007). Second, legal researchers confront more serious data limitations. The limited access to high-quality caseload data has been well-documented by researchers in the United States, who have expressed concern that data maintained by legal regulators is fragmented and incomplete, of questionable quality, and often unavailable to researchers (Hatamyar & Simmons 2004; Campbell & Kollman 1999; Rhode 1985). In many jurisdictions, court rules prevent access to such data. Where data do exist, information on complaints and the register of practicing lawyers may be held by separate agencies, or only stored for limited periods of time. Third, the empirical legal researchers who are working in this field have been more inclined to pursue qualitative research approaches based on case studies and international comparisons (Abel 2012; Levin 2012; Haller 2012; Shinnick et al. 2003; Christensen et al. 1999).

Salient similarities in the regulation of the medical and legal professions provide an opportunity for legal researchers to emulate the kinds of analyses that have been used

to examine medical misconduct. Of importance to this study, regulators of both professions use a registration- and licensing-based model, as well as complaint-based regulatory oversight. In both fields, the asymmetry of information between practitioners and their clients means that it is often difficult for clients to identify substandard practice; consequently, many complaints relate to more readily observable aspects of practice, such as costs and communication. Yet, in the absence of other more robust and transparent quality indicators, regulators in both professions remain heavily reliant on complaints as a mechanism for alerting them to individual instances of potentially substandard practice.

The goal of this study was to explore the power of large-scale legal regulatory data to advance understanding of the characteristics of lawyers who are subject to complaints and disciplinary action. We conducted our research in partnership with the Victorian Legal Services Board and Commissioner (LSBC), the statutory complaint handler and disciplinary prosecutor for the legal profession in Victoria, Australia.

The article proceeds as follows. Section II describes the evolution of regulation of the legal profession in Victoria, Australia, and surveys relevant empirical research on misconduct in the medical and legal literatures. Section III describes our data and methods. Section IV reports our main results. Section V discusses the risk factors for complaints that were identified in our analyses and explains the strengths and limitations of our approach. Section VI concludes.

II. BACKGROUND

A. *Regulation of Lawyers in Victoria, Australia*

Victoria is Australia's second most populous state, with nearly 6 million residents. The LSBC is the regulatory body charged with regulating the state's legal profession, and is accountable to the Victorian Parliament. Prior to the 1980s, lawyers in Victoria were largely self-regulated. Victoria and other Australian jurisdictions followed the United Kingdom's self-regulatory approach whereby lawyers were exposed to disciplinary action only when their professional colleagues found their conduct to be disgraceful or dishonorable (Haller 2003). The profession's control of both the investigatory and the adjudicatory phases of the process was justified by the claim that only lawyers themselves had the necessary expertise to assess and police the character and competence of their colleagues (Rueschemeyer 1983). This approach reflected a tradition of largely unfettered professional autonomy, a perception that professional ethics alone were sufficient to protect consumers, and a reluctance to recognize the rights of clients to complain about the quality of services provided (Christensen et al. 1999).

The legal profession's resistance to client-centered models of service and complaint resolution was heavily criticized in the 1970s and 1980s. Concerns about overcharging, delays, and poor communication were common. In Victoria, the most frequent client complaints at that time centered on incompetence and negligence (Haller 2003; Shinnick et al. 2003). In response to growing concerns, the Victorian Parliament passed new legislation establishing a client-focused standard for "unsatisfactory conduct," which was defined as: "A lawyer or firm falling short of the standard of competence and

diligence that a member of the public is entitled to expect of a reasonably competent legal practitioner or firm" (Legal Practice Act 1996, §§ 137–138). The statute also made provision for sanctions and remedial interventions for offenders, including punitive disciplinary measures as well as educational and supervisory requirements.¹

The Legal Profession Act 2004 followed the 1996 Act and was based on a model national law enacted to varying degrees across Australia's states and territories. This legislation deregulated the structure of law firms and allowed the establishment of incorporated legal practices, which do not restrict who may own shares in the entity. The legislation has been controversial, largely owing to concerns that external investment and commercial pressure may adversely affect professionalism and dilute individual responsibility for providing competent legal services (Parker 2004). To guard against such potential ethical risks, incorporated legal practices are required to implement and maintain "appropriate management systems," which are subject to a higher level of regulatory oversight than traditional law firms (Parker et al. 2010).² Lawyers in Victoria apply for an annual practicing certificate from LSBC each year if they are engaged in legal practice, and are subject to regulatory oversight by the LSBC.

B. The Complaints Process

The LSBC consists of two entities: the Legal Services Commissioner (the Commissioner), who receives and handles complaints about lawyers, and the Legal Services Board (the Board), which is responsible for all other regulatory functions. The two entities share a chief executive and staff (Figure 1). The Commissioner is the primary external avenue of redress for individuals who are dissatisfied with legal services or have concerns regarding a lawyer's professional conduct.

Lawyers and clients are encouraged to resolve matters between themselves where possible. Advice provided by the Commissioner in response to an initial enquiry will often be sufficient to avert the filing of a formal complaint. Any person or body may lodge a complaint about a lawyer and, in some circumstances, the Commissioner may initiate a complaint. In practice, most complaints are lodged by dissatisfied clients. As discussed in our limitations section, the fact that a complaint was lodged does not mean that misconduct occurred, nor does the absence of a complaint mean that services were of an appropriate standard. Complaints tend to reflect the types of concerns that have the most salience to clients.

Most complaints, particularly those that relate to cost disputes, are resolved by the Commissioner without a requirement for a formal disciplinary hearing. The most serious

¹The regime has been modified several times since 1996. The most recent revision, the Legal Profession Uniform Law Application Act 2014, commenced in Victoria in 2015, at the end of our study period.

²Section 2.7.10(3) requires legal practitioner directors to ensure that appropriate management systems are implemented and maintained. Appropriate management systems are subject to audit checks and compliance reporting requirements. Checks may include whether the legal practice has policies and procedures in place for conflict-of-interest identification and resolution, records management, and supervision of practice and staff.

Figure 1: Jurisdiction and functions of the Victorian Legal Services Board and Commissioner.

	Legal Services Board	Legal Services Commissioner
Statutory Objectives	<ul style="list-style-type: none"> - Ensure the effective regulation of the legal profession and the maintenance of professional standards. - Address concerns of clients and lawyers as well as provide for the protection of consumers of legal services. - Ensure management of trust accounts. 	<ul style="list-style-type: none"> - Provide a framework for resolution of disputes or issues. - Provide a scheme for the discipline of the Australian legal profession. - Monitor, promote and enforce professional standards.
Core Functions	<ul style="list-style-type: none"> - Maintain Register of Lawyers and Law Practices and Register of Disciplinary Action. - Manage practicing certificates, including ability to impose conditions on legal practice. - Oversee and audit trust accounts. 	<ul style="list-style-type: none"> - Receive and handle complaints about lawyers and law practices. - Resolve costs disputes. - Educate and inform the Victorian legal profession and community.
Powers	<ul style="list-style-type: none"> - Administer funds. - Register lawyers. - Issue, suspend or cancel practicing certificates. - Intervene in a practice. 	<ul style="list-style-type: none"> - Issue binding determinations where disputed amount is below \$10,000.

complaints result in disciplinary charges before a tribunal, which may lead to a lawyer having his or her license to practice restricted or suspended. The LSBC maintains detailed records of complaints received, the issues raised and their outcomes, and an up-to-date register of all lawyers in the state, including demographic data and place of work.

C. Risk Factors for Complaints and Disciplinary Action in the Legal Profession

The few empirical studies of complaints against lawyers that have been conducted to date have identified male sex (Bartlett 2008; Hatamyar & Simmons 2004; Curtis & Kaufman 2004), older age (Davies 1999; Hatamyar & Simmons 2004), and solo practice as risk factors for complaints and disciplinary actions (Brook 1997; Arnold & Hagan 1992; Levin et al. 2013).

Hatamyar and Simmons conducted a cross-sectional study of publicly reported disciplinary actions imposed against lawyers in the United States in 2000 (Hatamyar & Simmons 2004). The researchers struggled with substantial variation in the quality and availability of data across the 50 states, but managed to obtain and analyze 3,461 cases.³ The study showed that female lawyers were disciplined at a significantly lower rate than their male colleagues: while 24 percent of the lawyers in United States at the time of their study were female, nearly 90 percent (3,461/3,055) of disciplinary actions were against male lawyers. However, conditional on disciplinary action being taken, sex was not significantly associated with length of suspensions imposed. Similarly, examining disciplinary reports over a 15-year period from the Florida Bar, the licensing agency for practicing lawyers in that state, Curtis and Kaufman found a wide gap in the proportion of disciplinary actions involving male and female lawyers, with an average of 90 percent involving male lawyers (Curtis & Kaufman 2004).

Previous research also suggests that lawyers in older age groups have higher rates of some forms of disciplinary action than their younger colleagues. In a U.K. study, Davies analyzed 270 randomly selected orders issued by the Solicitors Disciplinary Tribunal between 1994 and 1996; the sample represented 49 percent of all orders issued in the period (Davies 1999). The study focused on dishonest conduct, which the Tribunal identified explicitly or implicitly in 37 percent of the cases analyzed, and found that older lawyers were overrepresented among offenders.⁴ Hatamyar and Simmons also found that disciplined lawyers in the United States were on average older than lawyers generally (Hatamyar & Simmons 2004). Their study found the median age of disciplined lawyers in 2000 was 50 for males and 46 for females; whereas the median age for U.S. lawyers in the same year was 45 (Carson 2004).

Another study from the United Kingdom and two studies from North America identified solo practice as a risk factor for complaints and disciplinary action (Brooke 1997; Arnold & Hagan 1992; Levin et al. 2013). In the United Kingdom, Brooke found that solicitors in solo practice were more likely to experience serious professional problems related to alcohol abuse than their peers working in other types of practices (Brooke 1997). Arnold and Hagan's analysis of prosecutions for professional misconduct in an unspecified Canadian province between 1979 and 1986 found that inexperienced lawyers and lawyers in solo practice had the highest rates of prosecution for complaints of misconduct (Arnold & Hagan 1992). However, part of this elevated risk may have been attributable to selective monitoring and enforcement—specifically, decisions by

³The researchers were able to access some of their data through the American Bar Association's Center for Professional Responsibility, which periodically publishes survey data on information received from the disciplinary agencies across the United States and also maintains the National Lawyer Regulatory Data Bank. The information provided by the states to the Center for Professional Responsibility is voluntary and the content varies by state.

⁴Davies did not provide the overall age distribution for all practicing solicitors in the United Kingdom from 1994 to 1996 when he conducted his study. However, he included "years qualified to practice" in his study and he grouped his sample into three categories: 24 percent had been qualified for under 10 years, 47 percent for between 10 and 20 years, and 29 percent for over 20 years. He found when looking at the legal profession as a whole, solicitors qualified for between 10 and 20 years were overrepresented for disciplinary action related to dishonest conduct as they accounted for 35 percent of all practicing solicitors in the United Kingdom during his study period.

regulatory agencies to target inexperienced lawyers and solo practitioners for surveillance and sanctioning.

In a series of studies, Levin found that solo practitioners are more likely to receive complaints and be disciplined. (Levin 1998, 2004, 2012, 2016; Levin et al. 2013). Similarly, an American Bar Association analysis of legal malpractice claims in 2011–2015 found that firms of five or fewer lawyers accounted for a disproportionately large share of them (MacGregor & Vail 2016). Possible explanations for this increased risk include lack of supervision from senior partners, individual or small business clients who may be more likely to initiate complaints than corporate clients, increased scrutiny of solo practitioners by regulators, and limited resources to handle disputes brought against them.

In sum, the existing body of quantitative research examining risk factors for complaints and disciplinary action against legal practitioners is small but provocative.

D. Risk Factors for Medical-Legal Events

In contrast, over the last 30 years, dozens of empirical studies have investigated patterns of, and risk factors for malpractice claims and unsolicited patient complaints against health-care professionals. This research has shown that readily identifiable characteristics of doctors—including specialty, age, sex, communication skills, and medico-legal and medical school history—are associated with elevated risks of both types of events (Sloan et al. 1989; Taragin et al. 1992; Levinson et al. 1997; Morrison & Wickersham 1998; Hickson et al. 2002; Kohatsu et al. 2004; Papadakis et al. 2005; Jena et al. 2011; Bismark et al. 2013).

More recent research has homed in on track records, and demonstrated that complaints and claims are highly maldistributed, clustering among a relatively small group of doctors (Tibble et al. 2017; Studdert et al. 2016; Spittal et al. 2015; Bismark et al. 2013; Jena et al. 2011; Rolph et al. 2007). For example, in a national sample of nearly 19,000 complaints about doctors lodged with Australian health complaints entities over an 11-year period, 3 percent of the medical workforce accounted for 49 percent of all complaints (Bismark et al. 2013). Similarly, a study of more than 66,000 paid malpractice claims in the United States found that approximately 1 percent of all practicing doctors accounted for 32 percent of paid claims (Studdert et al. 2016).

With many risk factors now relatively well established, the leading edge of this line of research has shifted toward development of tools that permit reliable, individual-level prediction of doctors at highest risk of entering “frequent-flyer” enclaves. The goal is to arm regulators with predictive tools that can help avert future harm by alerting regulators to high-risk practitioners before they accumulate troubling track records (Spittal et al. 2015).

III. METHODS

A. Data

Our sample consisted of all disciplinary complaints lodged with LSBC regarding lawyers registered to practice in Victoria between July 1, 2005 and June 30, 2015. Study data were collected onsite at the LSBC offices in Melbourne between February 2016 and June 2016.

Our analytic dataset was formed by combining two de-identified datasets: one consisted of lawyer-level information on all lawyers registered to practice in Victoria during the study period (lawyer dataset) and the other consisted of all complaints and misconduct findings made in relation to those lawyers during the study period (complaint dataset).

We collated the lawyer dataset from information submitted by lawyers in new and annual renewal applications for practicing certificates. The information we obtained included a unique code identifying each registered lawyer (common across years for the same practitioner); the sex and year of birth of each lawyer; a variable indicating whether the lawyer had authority to operate a trust account; and the location, structure, and size of the lawyer's practice. The data were longitudinal in nature, allowing specification of time-varying variables (e.g., practice location).

To be permitted to manage client funds held in trust by a practice, lawyers must first apply for and receive trust account authority from the LSBC (Legal Profession Uniform General Rules 2015, §§ 33–60).⁵ This authority gives rise to additional fiduciary responsibilities for the recipient lawyer and the potential for disciplinary charges when the rules are not strictly followed. The LSBC closely monitors the conferral of trust account authority. We obtained variables indicating which lawyers in the study dataset held such authority, and in what years.

The complaints dataset included fields indicating the area of law to which each complaint related, the date the LSBC received the complaint, the types of concerns raised in the complaint, and complaint outcomes. The complaints dataset also included a variable identifying the lawyer to whom the complaint related by means of the same unique practitioner code as appeared in the lawyer dataset.

We combined the lawyer and complaint datasets using the unique lawyer identifier to create a person-period analytical dataset. Each row in this dataset represented a year of practice by a particular practitioner. Complaints variables were recorded in the year in which the complaint occurred. Thus, a lawyer registered to practice in every year of our study period who had a complaint in 2009 would have had 10 rows of data and an indication of complaint (plus associated complaint-level variables) in the row pertaining to 2009.

We excluded lawyers who were younger than 26 years or older than 65 years, barristers,⁶ and lawyers who practiced interstate or overseas. The age restrictions were imposed because lawyers under the age of 26 years are often still in supervised legal

⁵The current legislation in Victoria overseeing the operation of trust accounts is under the Legal Profession Uniform General Rules 2015, which include specific requirements for lawyers holding trust account authority and the keeping of trust records.

⁶In Victoria, similar to other jurisdictions in Australia, the law profession includes both barristers and solicitors. A barrister, also known as an independent advocate, specializes in representing clients in court. An Australian lawyer who wishes to practice as a barrister generally does so by undertaking the Bar Readers' Course and serving as an apprentice to another barrister for a period of time. Barristers in Victoria are members of the Victorian Bar where they are governed by a different set of rules than solicitors, including the Uniform Conduct (Barristers) Rules and the Uniform Continuing Professional Development (Barristers), and they exclusively practice as a barrister. Solicitors, by contrast, may instruct barristers and represent clients in some courts.

practice, which means the nature of their work and complaint risk may differ from lawyers who are not subject to supervision. Lawyers over the age of 65 were excluded because they, on average, work fewer hours than their younger colleagues, thus reducing their work-time-related exposure to complaint risk and creating a possible confounder in our analyses.⁷ Barristers were excluded because they cannot be instructed directly by clients,⁸ making their profile of complaints not directly comparable to solicitors. We also excluded lawyers who were admitted to the legal profession but did not hold an annual practicing certificate because this indicated they were not engaged in (lawful) legal practice in Victoria during the study period.

B. Variables

We coded lawyers into 10-year age bands and allowed them to move bands during the study period, according to their age in each year. We classified lawyers' primary practice location as urban or nonurban using a standard geographical classification system (Australian Bureau of Statistics 2015). Under this classification system, major urban areas are defined as those areas with a population of 100,000 people or more, and urban areas are defined as having a population between 1,000 and 99,999.⁹ In Victoria, three-quarters of the state's population (around 4.5 million people) are categorized as living in major urban areas or urban areas. All other areas were defined as nonurban or rural areas and comprise the remaining quarter of the state's population (nearly 1.5 million people).

Type of legal practice was grouped into four categories, based on a classification system used by the LSBC: incorporated legal practice, traditional law firm (solo practitioners¹⁰ and law firms), in-house counsel (nonlegal or government employers and multidisciplinary partnerships), and community legal center. Lawyers may record more than one type of legal practice on their practicing certificate renewal; our variable used the one designated as their primary type.

The size of practice variable was based on the number of registered lawyers working within the same organization. For lawyers working in house at a government or corporate organization, this variable indicates the number of registered lawyers in the organization. We collapsed these organization-level lawyer counts into three categories: small (1–10 lawyers); medium (11–100 lawyers); and large (>100 lawyers). We chose 1 to 10 lawyers as

⁷We did not have access to working-hour data for the lawyers in our study, and were therefore unable to control for work-time-related exposure in our analyses. Previous research with doctors has shown that controlling for working hours reveals increased complaint risk among older practitioners (Tibble et al. 2017).

⁸Each barrister practices alone as an individual and is not permitted to practice in partnership or as an employee, and is not permitted to practice as the employer of any legal practitioner in active practice.

⁹The Australian Statistical Geographical Standard (ASGS) definitions for urban and rural areas are available at: <http://www.abs.gov.au/websitedbs/D3310114.nsf/home/Frequently+Asked+Questions#Anchor7>, last accessed on September 10, 2017.

¹⁰Solo practitioners are lawyers who are the sole principal of a law firm, but they may employ other lawyers.

our smallest category because the estimates were unstable with group-size specifications smaller than this.

As shown and further defined in Figure 2, we coded the issues raised in complaints into eight types based on a taxonomy developed and used by the LSBC. The categories

Figure 2: Complaint issue types and subissues.

Complaint Issue Type	Complaint Sub-Issues
Communication	Rudeness Threatening behavior Poor or no communication
Competence and diligence	Poor advice and case handling Delays Poor record management
Compliance	Failure to comply with regulatory requirements Failure to respond to regulator Practicing certificate issues
Costs	Disclosures regarding costs Billing issues Overcharging
Ethical matters	Confidentiality Fraudulent and misleading conduct Conflict of interest Inappropriate undertakings Communication with another lawyer's client False advertising Abuse of process Ceasing to act Instructions issue Failure to pay third party Failure to comply with court orders
Personal conduct	Inappropriate personal and interpersonal behavior Relating to sexual impropriety Discrimination and criminal activity
Trust accounts	Misuse of trust account money
Other	Concerns regarding Victorian Legal Aid Concerns outside of the LSBC jurisdiction

were: communication, competence and diligence, compliance, costs, ethical matters, personal conduct, trust accounts, and other. In addition, as part of routine case handling, the LSBC case managers coded the primary area of law to which each complaint issue related into the following categories: family, property, wills and estates, personal injury, commercial, criminal, debt collection, and other. Our analysis used the same categories.

C. Analysis

We used counts and proportions to describe characteristics of lawyers who were the subject of complaints, the legal workforce in Victoria over the study period, and the characteristics of complaints. We then conducted multivariate logistic regression analysis at the lawyer-year level to identify predictors of complaints.

The primary outcome in the regression analysis was the occurrence of a complaint. Specifically, the outcome variable had a value of 1 for each year in which a registered lawyer experienced one or more complaints and a value of 0 for each year in which a registered lawyer experienced no complaints. A secondary subanalysis was restricted to the subset of complaints that resulted in a misconduct finding; this outcome variable was specified in the same way. The covariates in both regression models were the lawyer's sex; the lawyer's age and trust account authority status in the relevant year; and the location, type, and size of the lawyer's practice in the relevant year.

Because our analytical dataset consisted of multiple observations over time for most lawyers, we fit this model using methods appropriate for panel data. Specifically, we used a generalized estimating equation for binary outcomes with a binary family and log link. This method accounts for within-lawyer covariance as well as the between-lawyer differences, and is a standard method in epidemiological research for repeated binary data.

We conducted all analyses using Stata statistical software (Stata Statistical Software: Release 14, College Station, TX).

D. Ethics Review

The University of Melbourne's Human Ethics Sub-Committee approved the study. The LSBC provided de-identified data under a strict data protection plan and deed of confidentiality.

IV. RESULTS

The analytical sample consisted of 20,090 lawyers aged between 26 and 65 years who were registered to practice law in Victoria between July 2005 and June 2015. Over this period, the LSBC received 15,887 complaints against 4,180 of these lawyers, an average of 3.8 complaints per lawyer among lawyers with one or more complaints. Many of the complaints involved multiple issues, with a total of 21,938 separate issues among the 15,887 total complaints.

A. Characteristics of Lawyers and Lawyers Subject to Complaints

Table 1 shows the characteristics of all registered lawyers in Victoria (Column 2) and the subset of them who were subject to complaints (Column 3) as at the beginning of the study period in 2005.

Female lawyers comprised half of the legal workforce (50 percent). Most lawyers practiced in urban areas (93 percent). Seventeen percent of lawyers had trust account authority. Over half of practicing lawyers (56 percent) worked in traditional law firms, 16 percent were in incorporated legal practices, and 22 percent were employed as in-house counsel. Nearly half the lawyers (48 percent) were based in small firms and one-quarter in large firms.

Among lawyers subject to complaints during the study period, lawyers practicing in nonurban areas accounted for 13 percent of all complaints. Over two-thirds of complaints (69 percent) involved male lawyers. Nearly half the complaints (47 percent) involved lawyers with trust account authority. Most complaints involved lawyers practicing in traditional law

Table 1: Characteristics at Baseline of All Lawyers in Victoria and Lawyers Subject to a Complaint, 2005–2015

<i>Characteristics</i>	<i>All Lawyers Percent (n = 20,090)*</i>	<i>Lawyers with Complaints Percent (n = 4,180)[†]</i>

[‡]Percentages calculated with $n = 21,526$ available observations as the denominator. Data missing for type of complaint for 2 percent of complaint issues ($n = 412$). Percentages do not sum to 100 due to rounding.

[‡]Complaint outcome not available for $N = 79$ complaint issues which remained open at the end of study period.

[‡]Percentages calculated with $n = 21,702$ available observations as the denominator. Data missing for outcome of 1 percent of closed complaint issue ($n = 157$).

firms (72 percent) and over a fifth of lawyers (22 percent) with complaints worked in an incorporated legal practice. Nearly three-quarters of complaints (72 percent) involved lawyers working in small firms, with only 6 percent involving lawyers from large firms.

1. Characteristics of Complaints

Clients or members of the public lodged 91 percent of complaints and 7 percent were lodged by lawyers' peers. The LSBC itself was the source of only 2 percent of complaints.

Three complaint issues featured in 79 percent of all complaints (Table 2): the cost of legal services (36 percent), competence and diligence (22 percent), and ethical

matters (21 percent). Complaint issues regarding communication (10 percent) and trust accounts (8 percent) comprised an additional 18 percent of all complaints. Complaints over compliance matters (3 percent) and personal conduct regarding a lawyer's character or behavior unrelated to a particular case (0.2 percent) were relatively rare. More than half of all complaint issues pertained to three areas of law: family law (24 percent), property (19 percent), and wills and estates (13 percent).

Almost all issues raised in complaints were resolved by the end of the study period (21,859/21,938). Three-quarters of the closed complaint issues were dismissed by the LSBC, 17 percent had a resolution with no misconduct finding and 7 percent resulted in a misconduct finding.¹¹

Five percent of the complaints lodged by clients or members of the public resulted in a misconduct outcome and 13 percent of complaints lodged by peers did. Though only 1 in 50 complaints were initiated by a regulatory agency, 50 percent of them resulted in a misconduct outcome (data not shown).

2. Risk Factors for Complaints

All six of the lawyer characteristics we examined in the multivariable regression analysis were associated with lawyers' odds of being subject to at least one complaint (Table 3). Compared with female lawyers, male lawyers had 49 percent higher odds of being named in one or more complaints (OR = 1.49, 95 percent CI: 1.37 to 1.62). The odds of experiencing complaints among lawyers with trust account authority were nearly 3 times higher, compared to lawyers without this authority (OR = 2.90, 95 percent CI: 2.69 to 3.13). Lawyers located outside the urban areas of Victoria had 27 percent higher odds of being subject to a complaint, compared with lawyers in urban areas (OR = 1.27, 95 percent CI: 1.15 to 1.41). Compared with lawyers aged 26 to 35 years, lawyers aged between 56 and 65 years had 1.56 times the odds of experiencing complaints (OR = 1.56, 95 percent CI: 1.41 to 1.73). Compared with lawyers working in traditional law firms, in-house lawyers (OR = 0.20, 95 percent CI: 0.17 to 0.23) and lawyers working in community legal centers (OR = 0.58, 95 percent CI: 0.49 to 0.70) had substantially lower odds of experiencing complaints, while lawyers employed in incorporated legal practices had 37 percent higher odds (OR = 1.37, 95 percent CI: 1.27 to 1.47). Lawyers in small firms had more than three times higher odds of complaints than lawyers in large firms (OR = 3.37, 95 percent CI: 3.01 to 3.78) and lawyers in medium-size firms had more than twice the odds (OR = 2.55, 95 percent CI: 2.26 to 2.88).

Rerunning the multivariable model after restricting the outcome to complaints resulting in misconduct findings showed similar results (Table 3). Only practice location ceased to be a significant predictor. The strength of the association increased for most of the rest of the predictors, especially small firm size (OR = 13.4, 95 percent CI: 7.71 to 23.2).

¹¹Resolved complaints include those that were dismissed or resolved.

V. DISCUSSION

This study adopted an epidemiological approach to the study of lawyers who are subject to complaints and misconduct findings in order to improve understanding of their characteristics. To the best of our knowledge, no previous studies of disciplinary risks have calibrated estimates against the full legal workforce of a jurisdiction, and none have explored such a comprehensive a set of descriptors.

Results aside, the study’s analytical approach study suggests a useful way for regulators of the legal profession to more fully use and learn from data they routinely collect. In this section, we discuss the study’s contribution to advancing the empirical evidence on lawyer misconduct and disciplinary action. We also consider strengths and limitations of our analytical approach.

A. Nature of Complaints and Complaint Outcomes

Complaints can illuminate common “on the ground” concerns about professionals, and can provide valuable insights into breaches of professional standards, as well as public and client expectations (Parker et al. 2010; Haller 2010). In our study, the three leading grounds for complaint were—in descending order of prevalence—costs, competence and diligence, and professional ethics.

Over a third of the complaints raised concerns about the cost of legal services. Unlike medical services, Australia has no universal system of insurance for legal services. Limited access to civil legal aid, coupled with the prohibition on contingent fees, mean that most legal services must be paid for out of pocket. These factors may help explain why costs are such a common flashpoint in lawyer-client relations (Semple 2013). At the end of our study period, new legislative rules were introduced requiring lawyers to provide clients at an early stage with an estimate of total legal costs for the services sought, as opposed to a price range, which had been permitted under prior rules.¹² To the extent that surprise bills and unmanaged expectations drive conflict, this reform may be salutary.

The second and third most common issues raised in complaints involved concerns about competence and diligence and ethical matters. Many competence and diligence complaints centered on concerns about poor advice and case handling, whereas complaints over ethical matters covered a heterogeneous array of concerns ranging from breaches of confidentiality to failures to comply with court orders (see complaint sub-issues listed in Figure 2). Similar types of unprofessional conduct have been identified as priority areas by the American Bar Association’s Center for Professional Responsibility.¹³

Although fellow practitioners are often well-placed to observe and assess misconduct among their peers, fewer than 10 percent of the complaints in our sample were lodged by them. This finding raises questions about barriers to lawyers speaking up about poor performance within the profession. Within the medical profession, similar concerns have been raised about a “club culture” that deters doctors from calling out risks to the public (Kennedy et al. 2001). In Australia, mandatory reporting laws now require all registered health practitioners to notify the regulator if a fellow practitioner has practiced while intoxicated, engaged in sexual misconduct, or placed patients at substantial risk of harm because of a health impairment or significant departure from professional standards (Bismark et al. 2014). Such duties have not yet been imposed on the legal

¹²Cost disclosure obligations where lawyers are required to provide a range for estimated legal costs were introduced in the Legal Practice Act 1996. The right of a client to request an itemized bill was introduced in the 1996 Act (Section 108) and preserved in subsequent legislation, the Legal Profession Act 2004 (Section 3.4.36). The current governing legislation has this provision in Legal Profession Uniform Law Application Act 2014 (Section 187). In addition, the 2014 Act requires lawyers to provide an estimate for legal costs (Section 174).

¹³This American Bar Association Center for Professional Responsibility regularly produces continuing legal education information for lawyers to identify common situations that lead to professional misconduct and recommends strategies to avoid them. http://www.abajournal.com/magazine/article/top_10_ethics_traps, last accessed June 19, 2017.

profession. Indeed, the Conduct Rules for the legal profession warn lawyers against making allegations of professional misconduct without reasonable grounds and supporting material, with no corresponding duty to speak up when a lawyer believes that a colleague's conduct is placing the public at risk of harm.¹⁴

The finding that fewer than 7 percent of all complaints resulted in a misconduct finding resonates with studies of doctors that have shown most complaints do not lead to adverse findings, regulatory action, or payments (Spittal et al. 2016; Mello et al. 2010). In the United States, legal malpractice claims that result in favorable verdicts for the plaintiffs are rare. Around 2.5 percent of legal malpractice claims reach a trial verdict, and only about a third of those find for the plaintiff (Kritzer & Vidmar 2015). Though it may be tempting to infer from these findings that unfounded complaints are common, such a conclusion is unwarranted. Complainants may have sincere concerns, which are only alleviated by the discovery of additional information through the complaint investigation process. Alternatively, regulators may face evidentiary difficulties in investigating and adjudicating certain forms of professional misconduct. It can be difficult to determine error from filings and orders in litigation because what seems like an error to one lawyer may be a smart tactical decision to another.

Our findings also raise questions about the perspectives, motivations, and knowledge of those who lodge complaints. Early evidence suggests that vulnerable groups, such as the elderly, the socioeconomically deprived, or those with an ethnic minority background may be less likely to participate in the regulatory process and file a complaint (Bismark et al. 2016; Carney et al. 2016). Further investigation focused on individuals who received substandard services but did not lodge a complaint may help illuminate biases and barriers in the types of misconduct that are brought to the attention of regulators. Analogous studies in the medical-legal realm have been illuminating (Burstin et al. 1993; Studdert et al. 2000; Bismark et al. 2006).

B. Factors Associated with Higher Risk of Complaint

1. Male Sex

Compared with their female peers, male lawyers had higher odds of both experiencing a complaint and being subject to a misconduct finding. The overrepresentation of males among disciplined lawyers is consistent with previous empirical studies of lawyer misconduct (Hatamyar & Simmons 2004; Curtis & Kaufman 2004). An important limitation of this finding is that we were unable to account for differences in hours worked by male and female lawyers. An estimate from another state in Australia, New South Wales, found that the proportion of female solicitors in part-time employment was twice that of male solicitors (23 percent vs. 14 percent) (Wallace et al. 2017a). This is relevant as lawyers who work part-time are likely to have fewer client encounters, which may partly explain their lower rate of complaints. Studies of doctors suggest that adjusting for hours worked

¹⁴Legal Profession Uniform Law Australian Solicitors' Conduct Rules 2015 under the Legal Profession Uniform Law. <https://www.legislation.nsw.gov.au/regulations/2015-244.pdf>, last accessed Jan. 25, 2018.

reduces, but does not eliminate, the higher complaint rate among male practitioners (Unwin et al. 2014; Tibble et al. 2017).

The doctor studies also show that male sex persists as a risk factor for complaints, malpractice claims, and disciplinary actions after adjusting for other confounders, including age and specialty. Why? Effective patient-doctor communication has been shown to reduce medico-legal risk. Prior research has also found systematic differences in communication style and quality by gender: female doctors are more likely to adopt a more collaborative style of communication in which they engage patients in decision making about their care and provide more emotional support (Levinson & Lurie 2004). A similar explanation may lie behind the increased risk of complaints among male lawyers.

Over the study period, there was a steady increase in the proportion of female lawyers, although women continue to be significantly underrepresented at the highest levels of the profession. Increases in the number of female law students and lawyers are also evident elsewhere in Australia and internationally (Wallace et al. 2017b; American Bar Association Statistics 2016). If the risk difference is real between male and female lawyers, and not explained by analytical artifacts such as exposure time or selective enforcement, then increasing numbers of women in the legal workforce should continue to exert downward pressure on the number and incidence—and likely also patterns—of misconduct complaints.

2. Older Age

We found that lawyers in the older age groups were at increased risk of complaints, including complaints with misconduct outcomes. This finding is broadly consistent with previous research in both the legal and medical professions (Unwin et al. 2014; Spittal et al. 2016; Hatamyar & Simmons 2004; Tibble et al. 2017). There are several plausible explanations for the seemingly counterintuitive finding that more experienced lawyers are at higher risk of complaint and misconduct findings. Younger lawyers tend to be more closely supervised and are less likely to be making major decisions on their own, while older lawyers may work in roles with higher levels of responsibility and accountability. For example, more senior lawyers may be subject to complaints in their capacity as a figurehead, especially in relation to concerns such as billing that implicate organization-wide policies and practices.

Differences in the nature of the work at hand aside, older age remains plausible as a risk factor. Skills may atrophy, especially among those working in professional isolation. Older lawyers may develop habits and set ways of operating that are (or become) out of step with professional standards; they may also become less vigilant as confidence in their own skills and knowledge grows. Additionally, some scholars have suggested that the risk of addiction and health issues may increase with age and, in turn, these factors may lead to higher risks of complaints and misconduct findings (Hatamyar & Simmons 2004; Davies 1999).

3. Trust Account Authority

Lawyers who held trust account authority had nearly three times the odds of experiencing complaints than those who did not have this authority. This is a clear “hot spot” of

risk, and highlights a possible target for continuing legal education. Although the issue codes we used were informative, they were not granular enough to determine the extent to which the risk was driven by complaints related directly to misuse of trust monies.

Visibility of potential misconduct may also play a role here. Legal regulators in Victoria and other states in Australia view the oversight of trust accounts as one of their primary functions and impose heavy compliance and reporting requirements in this area (Briton 2015; Parker et al. 2010). Thus, the finding that trust account authority is a risk factor for complaints may—at least in part—reflect the intensity of oversight rather than a higher incidence of troubling behavior of this subgroup.

4. Nonurban Practice

Lawyers who practiced in nonurban areas had higher risk of complaints, but not of complaints ending in misconduct findings. Several factors may be relevant in explaining this result, including client income and limited service availability.

Like most industrialized countries, incomes are lower in nonurban areas of Australia than in urban areas (Australian Bureau of Statistics 2011). In addition, nonurban areas have fewer lawyers per capita than urban areas (Law and Justice Foundation of New South Wales 2014), and some nonurban law firms in Australia report difficulty in attracting high-quality lawyers due to the lower salaries, professional isolation, and other challenges of regional and rural practice (Mundy et al. 2017). These supply constraints may cause clients frustration at the outset and compromise their ability to access high-quality legal services, an unhappy mix that may enhance risks of client dissatisfaction.

Concerns about the availability and quality of legal services outside cities are longstanding. Ongoing efforts to address the problem, such as the Rural, Regional and Remote (RRRLaw) initiative, have potential.¹⁵ Metrics such as client satisfaction levels and complaint rates warrant inclusion in any evaluations of their success.

5. Incorporated Legal Practice

Of all types of practice examined, lawyers working in incorporated legal practices were the most likely to experience complaints, even after adjusting for practice size.

The opportunity for firms to incorporate arose a year before the start of our study period with a legislative change in the Legal Profession Act 2004 that allowed incorporated legal practices to operate nationally (Grech & Morrison 2007). Over the study period, the proportion of lawyers working for incorporated legal practices in Victoria more than doubled from 7.5 percent in 2005 to 18.4 percent in 2015.

¹⁵The Law Council of Australia leads the RRRLaw initiative for the Australian government in response to a 2009 national study that found the difficulty attracting lawyers to practice in nonurban areas is having a negative impact on the people living in these communities when it comes to accessing legal services. The RRRLaw initiative provides incentives for recruitment as well as mentoring and professional support to promote retention. <http://rrrlaw.com.au/what-is-rrr-law/rrr-initiative/>, accessed on Jan. 25, 2018.

Theory provides a ready explanation for the elevated rise of complaints for practitioners in these firms: moral hazard. Directors of incorporated firms have less exposure to personal liability for their actions than do partners in traditional law partnerships, where joint and several liability applies. These protections may contribute to some lawyers behaving in ways that are contrary to the best interests of their clients—a risk of allowing incorporation that commentators identified early on (Parker 2004). Our finding, coupled with the rapid growth of this type of legal practice, points to an important area for additional research.

6. Small Practice

We found a negative association between practice size and complaint risk, with the odds of complaint decreasing with the number of fellow lawyers. Compared with lawyers in large legal practices, lawyers in small practices had more than three times the odds of experiencing a complaint and 13 times the odds of a misconduct finding—by far the largest effect size of any in our results. These findings are consistent with previous studies that found elevated risks among lawyers in solo practice and small firms (Arnold & Hagan 1992; Brook 1997; Levin et al. 2013).

There are many possible explanations for increased risk among lawyers working in small practices. First, some of the risk may be linked to differences in the mix of clients and work across firm sizes, with a greater share of smaller practices' work dealing with individual clients in one-off matters. By contrast, a greater share of larger practices' work involves corporate clients with whom the firm has ongoing, sometimes longstanding, professional ties—a relationship less likely to provoke disputes. Second, a larger share of work in smaller firms may be in areas (e.g., family law, wills, and estates) that are especially vulnerable to client-lawyer disputes. Levin has referred to such practice areas as zones of "personal plight," where disputes are emotionally charged, and clients are often vulnerable (Levin et al. 2013).

Third, lawyers in smaller practices tend to undertake a broader range of work and have less specialist expertise. Fourth, opportunities to stay abreast of relevant changes in the field are more plentiful within law firms, peers may act as a check on improper behavior, and team-based service may diffuse tensions that arise in one-on-one client relationships. Recognizing the distinctive challenges that solo and small practices face, the American Bar Association has established a dedicated resource center designed to support them.¹⁶

Fifth, larger firms have a range of other resources available to them to avert or manage client dissatisfaction. For example, some large firms have risk-management guidelines and procedures imposed on them by liability insurers. Many also have established management practices for quelling or resolving looming grievances, thereby averting regulator involvement (Levin 2004). Such resources are unusual in smaller firms.

Finally, biases in the intensity of regulatory oversight cannot be discounted as an explanation for the higher complaint risk among practitioners in small firms. Other

¹⁶https://www.americanbar.org/portals/solo_home/solo_home.html, last accessed Sept. 10, 2017.

researchers have suggested that regulators may focus disproportionately on them (Arnold & Hagan 1992; John 2014; Levin 2004). It was beyond the scope of this research to disentangle the force of these various explanations, but future research should.

C. Study Strengths and Limitations

Our study has two key strengths relative to existing work in this area: the scope of data collected and the sophistication of our analytic methods. As previously noted, data on lawyer discipline are fragmented and often not readily available. Curtis and Kaufman note the “Herculean effort” involved in conducting research on lawyer misconduct in the United States (Curtis & Kaufman 2004). Our study benefited from direct access to administrative data held by the LSBC and strong support from the regulator for the research.

Previous research into complaints and misconduct involving lawyers has relied largely on simple counts and percentages. Our use of adjusted analyses improved our ability to reduce risks of confounding and isolate the effect of certain firm and lawyer characteristics. For example, previous studies have suggested that overrepresentation of male lawyers in professional misconduct cases might be explained by the fact that older lawyers are more likely to be male and that age is a risk factor (Curtis & Kaufman 2004). We show that male sex remains a risk factor even after controlling for age, practice location, and size and type of law firm.

Notwithstanding the access to comprehensive data we enjoyed, we still encountered substantial challenges in establishing a clean and comprehensive dataset suitable for statistical analysis. Like most other regulators, the LSBC collects data for administrative rather than research purposes. For example, the LSBC process for renewal of annual practicing certificates does not collect information about hours worked or area of law for lawyers registered in Victoria. At least some of the difference in complaint risk between male and female lawyers is likely to be explained by men working longer hours, on average, and thus having greater exposure to the risk of complaints. Further background information, such as law school attended and country of training, may also have improved the precision of our estimates, and extended understanding of plausible risk factors. As is common when administrative datasets are deployed for research uses, we encountered missing and incorrect fields, inconsistent spelling of names for the same lawyer across years, use of multiple unique identifiers for the same lawyer, and missing data. A considerable amount of cleaning and recoding was required to prepare the data for analysis.

A broader limitation of our study stems from the data type: disciplinary complaints are an imperfect marker of quality. For one, they almost certainly represent the tip of the iceberg of substandard legal practice. For every consumer of legal services who lodges a complaint, there are undoubtedly many more who are aggrieved but do not act. Moreover, the complaints received by the Commissioner are likely to be skewed toward issues, such as cost and delays, that are visible to clients, rather than more technical errors such as a lawyer failing to ask a particular question at a deposition. Other reasons for not filing a complaint may include: lack of knowledge of complaint mechanisms; fear of repercussions; lack of confidence in the legal regulatory system; a preference for other means of resolving the dispute such as litigation; unwillingness to expend the time and effort

required; or membership in a vulnerable group that is less likely to participate in the regulatory process (Briton 2015; Carney et al. 2016; Bismark et al. 2011).

While the “undercomplaining” described above is likely to be the most important source of imprecision in attempts to use complaints to legal regulators as a window on incidents of substandard legal practice, “overcomplaining” also warrants mention. Laypeople typically struggle to know whether a lawyer did a poor or good job negotiating a contract or litigating a case. Some complainants are motivated by a misunderstanding of lawyers’ obligations, distress over losing a case, or personal rivalry. The high degree of consistency between our estimates from the model analyzing all complaints and the model analyzing complaints that resulted in misconduct findings is reassuring, and suggests that the presence of unfounded complaints does not materially affect the risk factors we identified.

Finally, similarities between the LSBC model and regulatory regimes governing the legal profession in other Australian states and jurisdictions abroad suggest that our methods and findings have relevance elsewhere, but generalizability beyond Victoria is unknown.

VI. CONCLUSION

Regulators of the legal profession are charged with protecting the public by ensuring lawyers are fit to practice law. However, their approach tends to be reactive and case based, focusing on the resolution of individual complaints. Regulators generally do not seek to identify patterns and trends across their broader caseloads and the legal profession as a whole. A more modern approach to regulation calls for regulators to make effective use of the administrative data they hold, to identify priority areas for intervention, and to better allocate scarce resources to reduce the risk of future harms (Bismark et al. 2015; Sparrow 2000).

Using data routinely collected by the main regulator of the legal profession in Victoria, Australia, we analyzed risk factors for complaints and misconduct findings. We emulated an analytic approach that has been used to study risk among doctors, and adapted it for the legal profession. We identified six risk factors associated with complaints among lawyers in Victoria: male sex, older age, holding trust account authority, and working in a legal practice that is smaller, in a nonurban location, or incorporated. Similar patterns are likely to exist in other jurisdictions in Australia and internationally.

For most regulators of the learned professions, peering past the “trees” of individual cases into a “forest” of caseloads is an intimidating prospect, and one that would constitute a radical break from established modes of doing business. Our findings suggest that for legal regulators, it is feasible, worthwhile, and, arguably, essential to effectively pursuing their dual mission of upholding professional standards and protecting the public from substandard legal services.
